## 1 Introduction

- 1.1 Brookbanks Consulting (BCL) is appointed by Bellway Homes to produce a surface water drainage report for a residential development on Land north east of King George V playing fields, Northaw Road East, Cuffley.
- 1.2 This Report has been prepared in order to satisfy the following surface water drainage planning conditions with respect to the outline planning permission (ref. S6/2015/1342/PP) issued 31<sup>st</sup> March 2022 by Welwyn Hatfield.

#### 1.3 Condition 6. Surface Water -

No development shall take place until a detailed surface water drainage scheme for the site based on the approved drainage strategy and sustainable drainage principles has been submitted to and approved in writing by the Local Planning Authority. The drainage strategy should demonstrate the surface water runoff generated up to and including the 1 in 100year plus climate change critical event will not exceed the run off from the undeveloped site following the corresponding rainfall event. The scheme shall also include:

a) Detailed engineering drawings of the proposed SuDS features including cross section drawings, their size, volume, depth and any inlet and outlets features including any connecting pipe runs.

*b)* Final detailed post development network calculations for all storm events up to the 1 in 100year plus 40% climate change event with half drain down times less than 24 hours.

c) Assessment of the surface water flow path and the volumes to be managed as part of the development.

d) Exceedance flow routes for storms greater than the 1 in 100year plus 40% climate change event.

*e)* Final detailed management plan to include arrangements for adoption and other arrangements to secure the operation throughout its lifetime.

The mitigation measures shall be fully implemented prior to occupation and maintained in accordance with the timing/ phasing arrangements embodied within the scheme or any other period as may subsequently be agreed in writing by the Local Planning Authority.

Reason: To reduce the risk and impact of flooding by ensuring the satisfactory storage and disposal of surface water from the site; and to ensure surface water can be managed in a sustainable manner in accordance with Policy R7 and R10 of the Welwyn Hatfield District Plan 2005; Policy SADM14 of the draft Local Plan Proposed Submission August 2016; and the National Planning Policy Framework.

#### 1.4 Condition 19. Surface Water -

The development hereby permitted must be carried out in accordance with the approved Flood Risk Assessment prepared by Brookbanks (ref. 10710 FRA01 Rv0 dated 11 June 2021) and the following mitigation measures detailed within the Flood Risk Assessment.

a) Limiting the surface water run off generated by the critical storm events so that it will not exceed the surface water run off rate of 8.2 l/s during the 1 in 100year plus 40% climate change event.

*b)* Providing storage to ensure no increase in surface water volumes up to the 1 in 100year plus 40% climate change event providing a minimum of 1,494m<sup>3</sup> (or such volume agreed with the LLFA ) of total storage volume in attenuation basin and swale.

c) Discharge of surface water from the private drain into the ordinary watercourse south of the site.

The mitigation measures shall be fully implemented prior to occupation and maintained in accordance with the timing/ phasing arrangements embodied within the scheme or any other period as may subsequently be agreed in writing by the Local Planning Authority.

Reason: To reduce the risk and impact of flooding by ensuring the satisfactory storage and disposal of surface water from the site; and to ensure surface water can be managed in a sustainable manner in accordance with Policy R7 and R10 of the Welwyn Hatfield District Plan 2005; Policy SADM14 of the draft Local Plan Proposed Submission August 2016; and the National Planning Policy Framework This report should be read in in accordance with the engineering drawings and other documents included in the Reserved Matters submission.

**1.5** This report should be read in in accordance with the engineering drawings and other documents included in the Reserved Matters submission.

## 2 Surface Water Drainage

## Background

- 2.1 The strategic surface water drainage scheme is based on the principles set out in the Flood Risk Assessment (FRA) (ref. 10710/FRA01/rev0) submitted and approved as part of the outline planning application.
- 2.2 The FRA outlined the drainage strategy for the development which included for flows to discharge via detention basins 1 and 2 to an existing ordinary watercourse flowing along the southern boundary of the Site conveying flows generally in a south easterly direction towards the Northaw Brook.

### **Baseline Conditions**

2.3 The FRA includes baseline site discharge assessments using the nationally accepted IoH124 methodology for small rural catchments. Local policy is to employ IoH124 in a manner set out by CIRIA C697. This methodology requires that, for catchments of less than 50ha, the IoH assessment is completed for a 50ha area with the results linearly interpolated to determine the flow rate value based on the ratio of the development to 50ha.

#### 2.4 The baseline IoH run-off rates are shown on Table 2.1 below:

Event	IOH scaled to (l/s/ha)
1 in 1 year	3.30
Qbar	3.88
1 in 100 year	12.39

Table 2.1: IoH124 baseline discharge rates

**2.5** To determine the permitted rates of run-off from the development, the future impermeable catchment areas must be derived. This has been based on a BCL measured ratio from previous projects. Calculations below show these ratios and areas and how this correlate to the rates of discharge.

Catchment	Impermeable Area (ha)	Existing 100year run-off (I/s)	Proposed 100year run-off (I/s)
1	2.046	25.35	6.5
2	0.072	0.89	1.7

#### **2.6** The calculations for this are shown in Table 2.2 below:

- 2.7 Using these methods, development at the site will comply with the requirements set out in paragraph 9 of the Technical Guide to the National Planning Policy Framework (NPPF), with the discharge of surface water from the proposed developments not exceeding that of the existing greenfield sites, thus ensuring that there is no material increase in the flood risk to surrounding areas.
- **2.8** The proposed discharge rate from Basin 2 has been increased from the baseline greenfield rate, as such a small rate would have led to a small opening being required in the flow control which would have the potential for blockage.
- 2.9 Assessments have thereafter been completed to determine the characteristics of proposed SuDS features to be situated within the development. Best practice methods have been employed by performing detention routing calculations for both the 1 in 2year, 1 in 30year and 1 in 100 years + 40% climate change events.

### Surface Water Strategy

- **2.10** The preferred option for the disposal of surface water utilises two outfall points into the existing ditch to the south of the Site.
- **2.10** Calculations have determined the volumes required to attenuate storm water discharges from the Site during the critical 1 in 100 year + 40% climate change storm event.
- 2.11 Peak discharges will be limited to the equivalent to the mean annual storm (Qbar), estimated by the IoH124 calculations above, representing a circa 69% reduction on peak greenfield rates. Table 2.3 below summarises the overall detention requirements.

Catchment 1	Impermeable Area (ha)	Proposed 100year run-off (l/s)	Detention volume during 1:100year (+40%cc) event
1	2.169	6.5	1,940
Swale			21.0
2	0.079	1.7	42.8
TOTAL	2.248	8.2	2,003.8

- **2.12** Hydraulic calculations include Volume : Time graphs for each basin which demonstrate the half drain down times during the critical 1 in 100 year + 40% climate change storm event are approximately 2256 minutes and 252 minutes for Basins 1 and 2 respectively.
- 2.13 Detailed MD hydraulic calculations are included in Appendix C.

## **Drainage Proposals**

2.14 Preliminary assessment of the requirements for storm drainage have been based on the following criteria:

Criteria	Measure/Rate/Factor
Impermeability factor – Residential	0.55
Impermeability factor – Highways	1.00
Urban Creep allowance	10%
Sewer design return period	1 in 2 year
Sewer flood protection	1 in 30 years
Fluvial / Development flood protection	1 in 100 years
M5-60	20.0 mm
Ratio r	0.40
Minimum cover to sewers	1.2 m
Minimum velocity	1.0 m/sec
Pipe ks value	0.6 mm
Climate change	40%

Table 2.4: Drainage Criteria and Measures

- A surface water sewer layout serving the development has been shown on Drawing No's 10929-500-001
   & 002 included in Appendix B to demonstrate the layout of the drainage system and location of proposed SuDS features.
- 2.16 Hydraulic design and analysis of the strategic surface water drainage systems has been completed using the MD Network module for various storm events up to the 1 in 100year (+40%cc) maximum design storm event. The surface water system including the detention basins has been tested against the 1:2year, 1:30year and the 1 in 100year (+40%cc) events using FEH2013 rainfall data.
- 2.17 Surface water sewers have been designed in accordance with the Sewerage Sector Guidance Appendix C
   Design & Construction Guidance (DCG) (formerly Sewers for Adoption) and will be offered to Thames
   Water (TW) or New Appointment and Variations (NAV) for adoption under a Section 104 agreement.
   Further detailing of the drainage design will be undertaken as part of the Section 104 submission to TW.
- **2.18** Surface water sewers have been designed in accordance with DCG standards for no pipe surcharging during a 1 in 2 year storm event and no surface flooding during a 1 in 30 year storm event.
- **2.19** The surface water system has also be checked against storms up to the 1 in 100 year (+40%cc) event, in accordance with DCG requirements. Results show there is no surface water flooding from the system during the 1 in 100 year (+40%cc) event.
- **2.20** Impermeable areas have been measured from the Cuffley Appraisal Layout included in Appendix A. An urban creep factor of 10% has been applied to plot development impermeable areas to allow for future urban expansion. A schedule of impermeable areas is included in the Appendix.

### **Overland Flows**

- **2.21** The FRA identified that an overland surface water flow paths crosses the existing site. The flow path follows the natural topography from the higher ground to the north of the site down to the watercourse flowing along the southern boundary.
- **2.22** The approved FRA however concluded that 'given the baseline site characteristics and further mitigating measures to be implemented residual flood risk from an overland flow mechanism is considered of a low probability'.
- 2.23 Extracts from EA Surface water flood mapping GIS data are included in Figure 2.5. This shows the extents of medium risk chance of flooding between 1 in 100 Year Return (1%) and 1 in 30 Year Return (3.3%). The flood extents extends north into the proposed development area from the existing watercourse. Extracts also indicate the depth of flooding to be generally 0.0 0.15m within the site. The majority of the

proposed development will be within areas that have a very low potential risk of flooding from surface water.

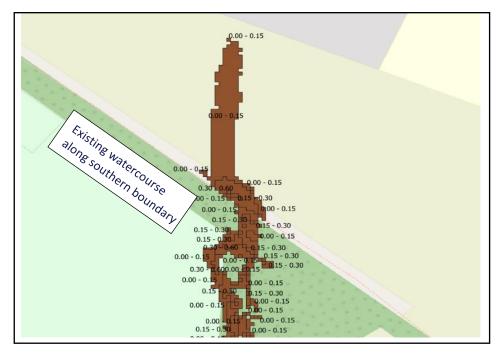

Figure 2.5: EA Surface water flood mapping 1:100year event

- 2.24 The new development will manage the existing surface water flood extents by developing the site with residential dwellings and altering the site topography. A new stormwater drainage and SuDS management system will also be constructed which will alter the surface run off regimes within the site. Surface water flows generated within the proposed site will now be collected by the new drainage scheme and exceedance routes associated with the drainage infrastructure have been established.
- 2.25 Although of a low flood risk, during the 1 in 100 year (+40%cc) event the potential for a surface water flow path originating at the north of the site from South Drive has also been considered. Surface water flood modelling has been undertaken to assess this impact at the request of the LLFA. Technical note 10929-TN01 accompanies this report and provides the modelling results for the existing baseline and post development conditions for the 1 in 1000yr and 1 in 100yr+ 40%CC rainfall events. Flood modelling demonstrates that the proposed surface water drainage system can manage the potential surface water flooding effectively.
- 2.26 The inflow hydrograph from the flood modelling has been added to PN 2.008 (MH S13) in the Micro Drainage model to replicate the impact of the surface water flooding collecting within the proposed carpark area south of South Drive and then being passes into the drainage network. This causes a marginal increase (< 100m3) in the volume requirement at Basin 1 due to the inflow for the critical 960min 1:100year (+40%cc) return period event. Exceedance from the pipe system is not an issue as the critical</p>

storm duration (15-30minutes) for the pipes will have passed before the surface water flood inflow commences (peak occurring after 960mins).

2.27 The revised basin area and volume is detailed on Drawings 10929-500-001 & 002 included in Appendix B and shows that the depth of the pond remains at 1.4m +0.3m freeboard with the proposed volume increased by a change in the pond area. 10929-500-004 D - Exceedance Plan is also included in the Appendix.

### **Exceedance Flows**

- **2.27** As a result of extreme rainfall it is inevitable that the capacities of sewers and other drainage systems will be exceeded on occasion. Periods of exceedance occur when the rate of surface runoff exceeds the drainage system inlet capacity, when the pipe system becomes overloaded, or when the outfall becomes restricted due to flood levels in the receiving water.
- 2.28 Underground conveyance cannot economically or sustainably be built large enough for the most extreme events and, as a result, there will be occasions when surface water runoff will exceed the design capacity of drains. When drainage system capacity is exceeded the excess water (exceedance flow) is conveyed above ground, and will travel along streets and paths, and across open space areas.
- **2.29** The topography of the majority of the site falls towards the existing watercourse flowing along the southern boundary.
- **2.30** The proposed levels for the development site will replicate the existing topography, subject to acceptable development gradients, and strategic drainage exceedance flow paths have been designed to follow above ground routes towards the southern boundary.
- **2.31** Drawing 10929-500-004 Exceedance Plan shows exceedance flow directions have been established through the strategic highway network of the development with flows routed to discharge at crossings to the southern boundary.
- **2.32** Basins and swales have also been designed with freeboard allowances above maximum design storm event water levels and spare capacity is available for exceedance run-off during more extreme events.

### Water Quality

2.33 Impermeable surfaces collect pollutants from a wide variety of sources including cleaning activities, wear from car tyres, vehicle oil and exhaust leaks and general atmospheric deposition (source: CIRIA C609). The implementation of SUDS in development drainage provides a significant benefit in removal of pollutant from development run-off.

- **2.34** The SuDS Manual C753 describes a 'Simple Index Approach' for assessing the pollution risk of surface runoff to the receiving environment using indices for likely pollution levels for different land uses and SUDS performance capabilities. A 'Simple Index Approach' assessment has been undertaken below.
- 2.35 CIRIA document C753 Table 26.2, as shown in Table 2.5 below, indicates the minimum treatment indices appropriate for contributing pollution hazards for different land use classifications. To deliver adequate treatment, the selected SuDS components should have a total pollution mitigation index (for each contaminant type) that equals or exceeds the pollution hazard index.
- **2.36** For Phase 1B (typically a residential type development), run-off from low traffic roads such as cul-de-sacs and individual property driveways pose the worst case pollution hazard.

Land Use	Pollution Hazard Level	Total suspended solids (TSS)	Metals	Hydro-carbons
Residential roofs	Very Low	0.2	0.2	0.05
Individual property driveways, residential car parks, low traffic roads (e.g. cul-de-sacs, home zones and general access roads) and non-residential car parking with infrequent change (e.g. schools, offices) i.e. < 300 traffic movements/day	Low	0.5	0.4	0.4

Table 2.6 CIRIA 753 Table 26.2 Pollution Hazard Indices

Type of SUDS component	Total suspended solids (TSS)	Metals	Hydro-carbons
Detention Basin	0.5	0.5	0.6
Swales	0.5	0.6	0.6

 Table 2.7
 CIRIA 753 Table 26.3 SuDS Mitigation Indices for discharges to surface waters.

- 2.37 To provide the correct level of treatment, an assessment needs to be made of the mitigation provided by each SuDS feature. Table 26.3 of The SuDS Manual CIRIA document C753 shown as Table 2.6 for discharges to surface waters indicate the treatment mitigation indices provided by each SuDS feature.
- 2.38 Typically the strategic surface water system provides treatment of flows utilising a minimum of two SuDS features. Catchment 1 drains via a swale and detention basin 1. However with only a small area of plot development (0.079ha) within catchment 2, it is considered detention basin 2 will be sufficient to cater for the pollution risks posed. Pollution mitigation indices for treatment scenarios are shown in Table 2.7.
- **2.39** The SuDS management train being promoted for the development has been tailored to encourage passive treatment and from the above assessment in accordance with the 'Simple Index Approach' procedure,

ref: Table 2.7, the combined SuDS pollution mitigation proposals are sufficient to manage the pollution hazards arising from the development.

Catchment Ref:	Pollution Hazard/ Mitigation Indices	Total suspended solids (TSS)	Metals	Hydro-carbons
1	Pollution Mitigation Indices (Swale>Basin1)	0.75	0.85	0.90
	Water Pollution Management	Sufficient	Sufficient	Sufficient
2	Pollution Mitigation Indices (Basin2)	0.50	0.50	0.60
	Water Pollution Management	Sufficient	Sufficient	Sufficient

 Table 2.7:
 Simple Index Approach Assessment

## Implementation

- 2.40 The anticipated build programme is 26 months starting October 2022. 40 units being delivered year 23/24 and 81 units being delivered in 24/25.
- **2.41** Implementation of the storm water management system will be undertaken prior to first occupation of dwellings.

## 3.0 SuDS Maintenance

- **3.1** In accordance with condition 20 within the outline planning permission, upon completion of the drainage works for the site in accordance with the timing/ phasing arrangements, a management and maintenance plan for the SuDS features and drainage system will be submitted to and approved in writing by the Local Planning Authority. The management and maintenance plan will include:
  - i. Provision of complete set of as-built drawings for site drainage
  - ii. Maintenance and operational activities
  - iii. Arrangements for adoption and other measures to secure the operations of the scheme throughout its lifetime.

### Background

- **3.2** Storm water from the proposed main access road and residential development will drain into the basin 1 in the south east of the site which has downstream flow controls prior to discharging into the existing watercourse. A small area of residential development drains to basin 2 in the south of the site which also has downstream flow controls prior to discharging into the existing watercourse.
- **3.3** Basins 1 and 2 have storage volumes of approximately 1,940m<sup>3</sup> and 48m<sup>3</sup> respectively during the 1 in 100 year (+40%cc) storm event.
- **3.4** The control chambers to the detention basins both incorporate a hydrobrake flow control set to limit discharges to the greenfield Qbar rate of 6.5 l/s and 1.7 l/s respectively during storms up to the 1 in 100 year (+40%cc) event.
- **3.5** In accordance with legislative requirements, the detention proposals have been assessed for the potential effects of climate change. The 1 in 100 year (1% AEP) return events have been modelled with 40% climate change allowance and show the detention basin performs adequately by retaining the additional flows within the system while maintaining a minimum 300mm freeboard.
- 3.6 Discharges of surface water to the existing watercourse will be subject to Land drainage consent.

### SuDS Maintenance & Management Arrangements

- **3.7** The upstream surface water sewer system draining to the detention basin will be offered to TW or NAV for adoption under a section 104 agreement for future adoption and maintenance.
- **3.8** The detention basins, including the downstream headwall, control chamber and outlet pipe and grass swale will be managed and maintained by a private management company on behalf of the developer.

- **3.9** Detailed plans and design drawings indicating features and areas which are to be maintained by the private management company will be included in the management and maintenance plan.
- **3.10** The development layout provides adequate access and working areas in order to undertake the above maintenance procedures. Formal rights of access will be provided, where necessary, to the management company, if required.

### **Maintenance Schedules**

**3.11** The management and maintenance plan will include best practice guidance based on typical maintenance regimes for SuDS features as shown in the tables below:

Maintenance Schedule	Required Action	Typical Frequency
	Remove litter (including leaf litter) and debris	Monthly or as required
	Cut grass for spillways and access routes	Monthly during growing season or as required
	Manage other vegetation and remove nuisance plants	Monthly at start, then as required
	Inspect inlets, outlets and overflows for blockages, and clear if required.	Monthly
Regular Maintenance	Inspect banksides, structures, pipework etc for evidence of physical damage	Monthly or when required
	Inspect inlets and facility surface for silt accumulation. Establish appropriate silt removal frequencies	Monthly for 12 months, then annually or as required
	Check any penstocks and other mechanical devices	Annually
	Tidy all dead growth before start of growing season	Annually
	Remove sediment from inlets, outlet and forebay	Annually or as required
	Manage wetland plants in outlet pool- where provided	Annually
	Reseed areas of poor vegetation growth.	As required
Occasional Maintenance	Prune and trim any trees and remove cuttings	Every 2 years or as required
	Remove sediment from inlets, outlet and forebay and main basin	Every 5 years or as required

Remedial	Repair erosion or other damage by re-turfing or reseeding	As required		
Actions	Re-alignment of rip-rap	As required		
	Repair/ rehabilitate inlets, outlets and overflows	As required		
	Relevel uneven surfaces and reinstate design levels.	As required		

Table 3.1: Recommended maintenance activities for Detention basins

Maintenance Schedule	Required Action	Typical Frequency
	Remove litter (including leaf litter) and debris	Monthly or as required
Regular Maintenance	Cut grass to retain grass height with specified design range	Monthly during growing season or as required
	Manage other vegetation and remove nuisance plants	Monthly at start, then as required
	Inspect inlets, outlets and overflows for blockages, and clear if required.	Monthly
	Inspect infiltration surfaces for ponding, compaction, silt accumulation, record areas where water is ponding > 48 hours	Monthly or when required
	Inspect vegetation coverage	Monthly for six months, quarterly for 2 years , then half yearly
	Inspect inlets and facility surface for silt accumulation, and establish appropriate silt removal frequencies	Six Monthly
Occasional Maintenance	Reseed areas of poor vegetation growth, alter plant types to better suit conditions, if required.	As required or if bare soil is exposed over 10% or more of the swale treatment area
	Repair erosion or other damage by re-turfing or reseeding	As required
Remedial Actions	Relevel uneven surfaces and reinstate design levels	As required
	Scarify and spike topsoil layer to improve infiltration performance, break up silt deposits and prevent compaction of the soil surface.	As required

Remove build-up of sediment on upstream gravel trench, flow spreader or at top of filter strip.	As required
Remove and dispose of oils or petrol residues using safe standard practices	As required

Table 3.2: Recommended maintenance activities for swales

## 4.0 Foul Water Drainage

### Background

- **4.1** The foul water drainage scheme is based on the principles set out in the Flood Risk Assessment (FRA) (ref. 10710/FRA01/rev0) submitted and approved as part of the outline planning application.
- **4.2** The FRA outlined the drainage strategy for the development which included for flows to discharge to an existing public sewer crossing within the site.

## **Point of Connection**

- **4.3** Foul drainage proposals have been developed in consultation with TW that provide for an on-site connection to the existing public sewer crossing within the site.
- **4.4** TW are instructed to undertake a modelling study to assess the impacts of the development. At the time of writing this report timescales are awaited from TW to confirm the delivery date for the modelling study results.
- **4.5** Water companies have a statutory obligation through the Water Industry Act 1991, 2003 et al., to provide capital investment in strategic treatment infrastructure to meet development growth. This investment planning is managed and regulated by OFWAT through the Asset Management Plan (AMP) process. The five yearly cyclical process requires that water companies allocate finances to a range of strategic projects to meet their statutory obligations.
- **4.6** Where development programming requirements necessitate the reinforcement of facilities ahead of allocation in an AMP period, mechanisms are available to ensure the infrastructure can be delivered in a timely fashion, to meet the development programme.

## 5.0 Summary

- **5.1** The purpose of this Report is to set out details of the proposed surface water drainage scheme to manage surface water run-off from the development, as required by Conditions 6 and 19 of the outline planning permission.
- **5.2** A strategy for storm drainage at the site has been developed to meet both national and local policy. The above proposals employ means of drainage to comply with NPPF guidance, together with SFRA and other national and local guidance.
- **5.3** The drainage proposals will manage storm water by way of a SUDS management train and ensure peak discharges from the developed land provide betterment from the appraised baseline rates.
- **5.4** The proposals will also provide to maintain the quality of water discharged from the development during the construction and operational stages.
- **5.5** The storm water management proposals will improve the amenity and biodiversity of the site.
- **5.6** The storm water system has been designed so that it is suitable for adoption by TW or NAV for future maintenance. Future maintenance of the non- adoptable SuDS elements of the system will be undertaken by a private management company for the site.
- **5.7** Implementation of the storm water management system will be undertaken prior to first occupation of dwellings.
- **5.8** This Report demonstrates that against the requirements of the relevant conditions a suitable scheme for the discharge of surface water has been designed in accordance with the approved Surface Water Drainage Strategy contained within the approved FRA. The drainage scheme, designed and constructed in accordance with DCG standards with outfalls at agreed points of discharge, will be put in place to minimise the impacts of development during the construction and operational stages and cater for future phases of development.

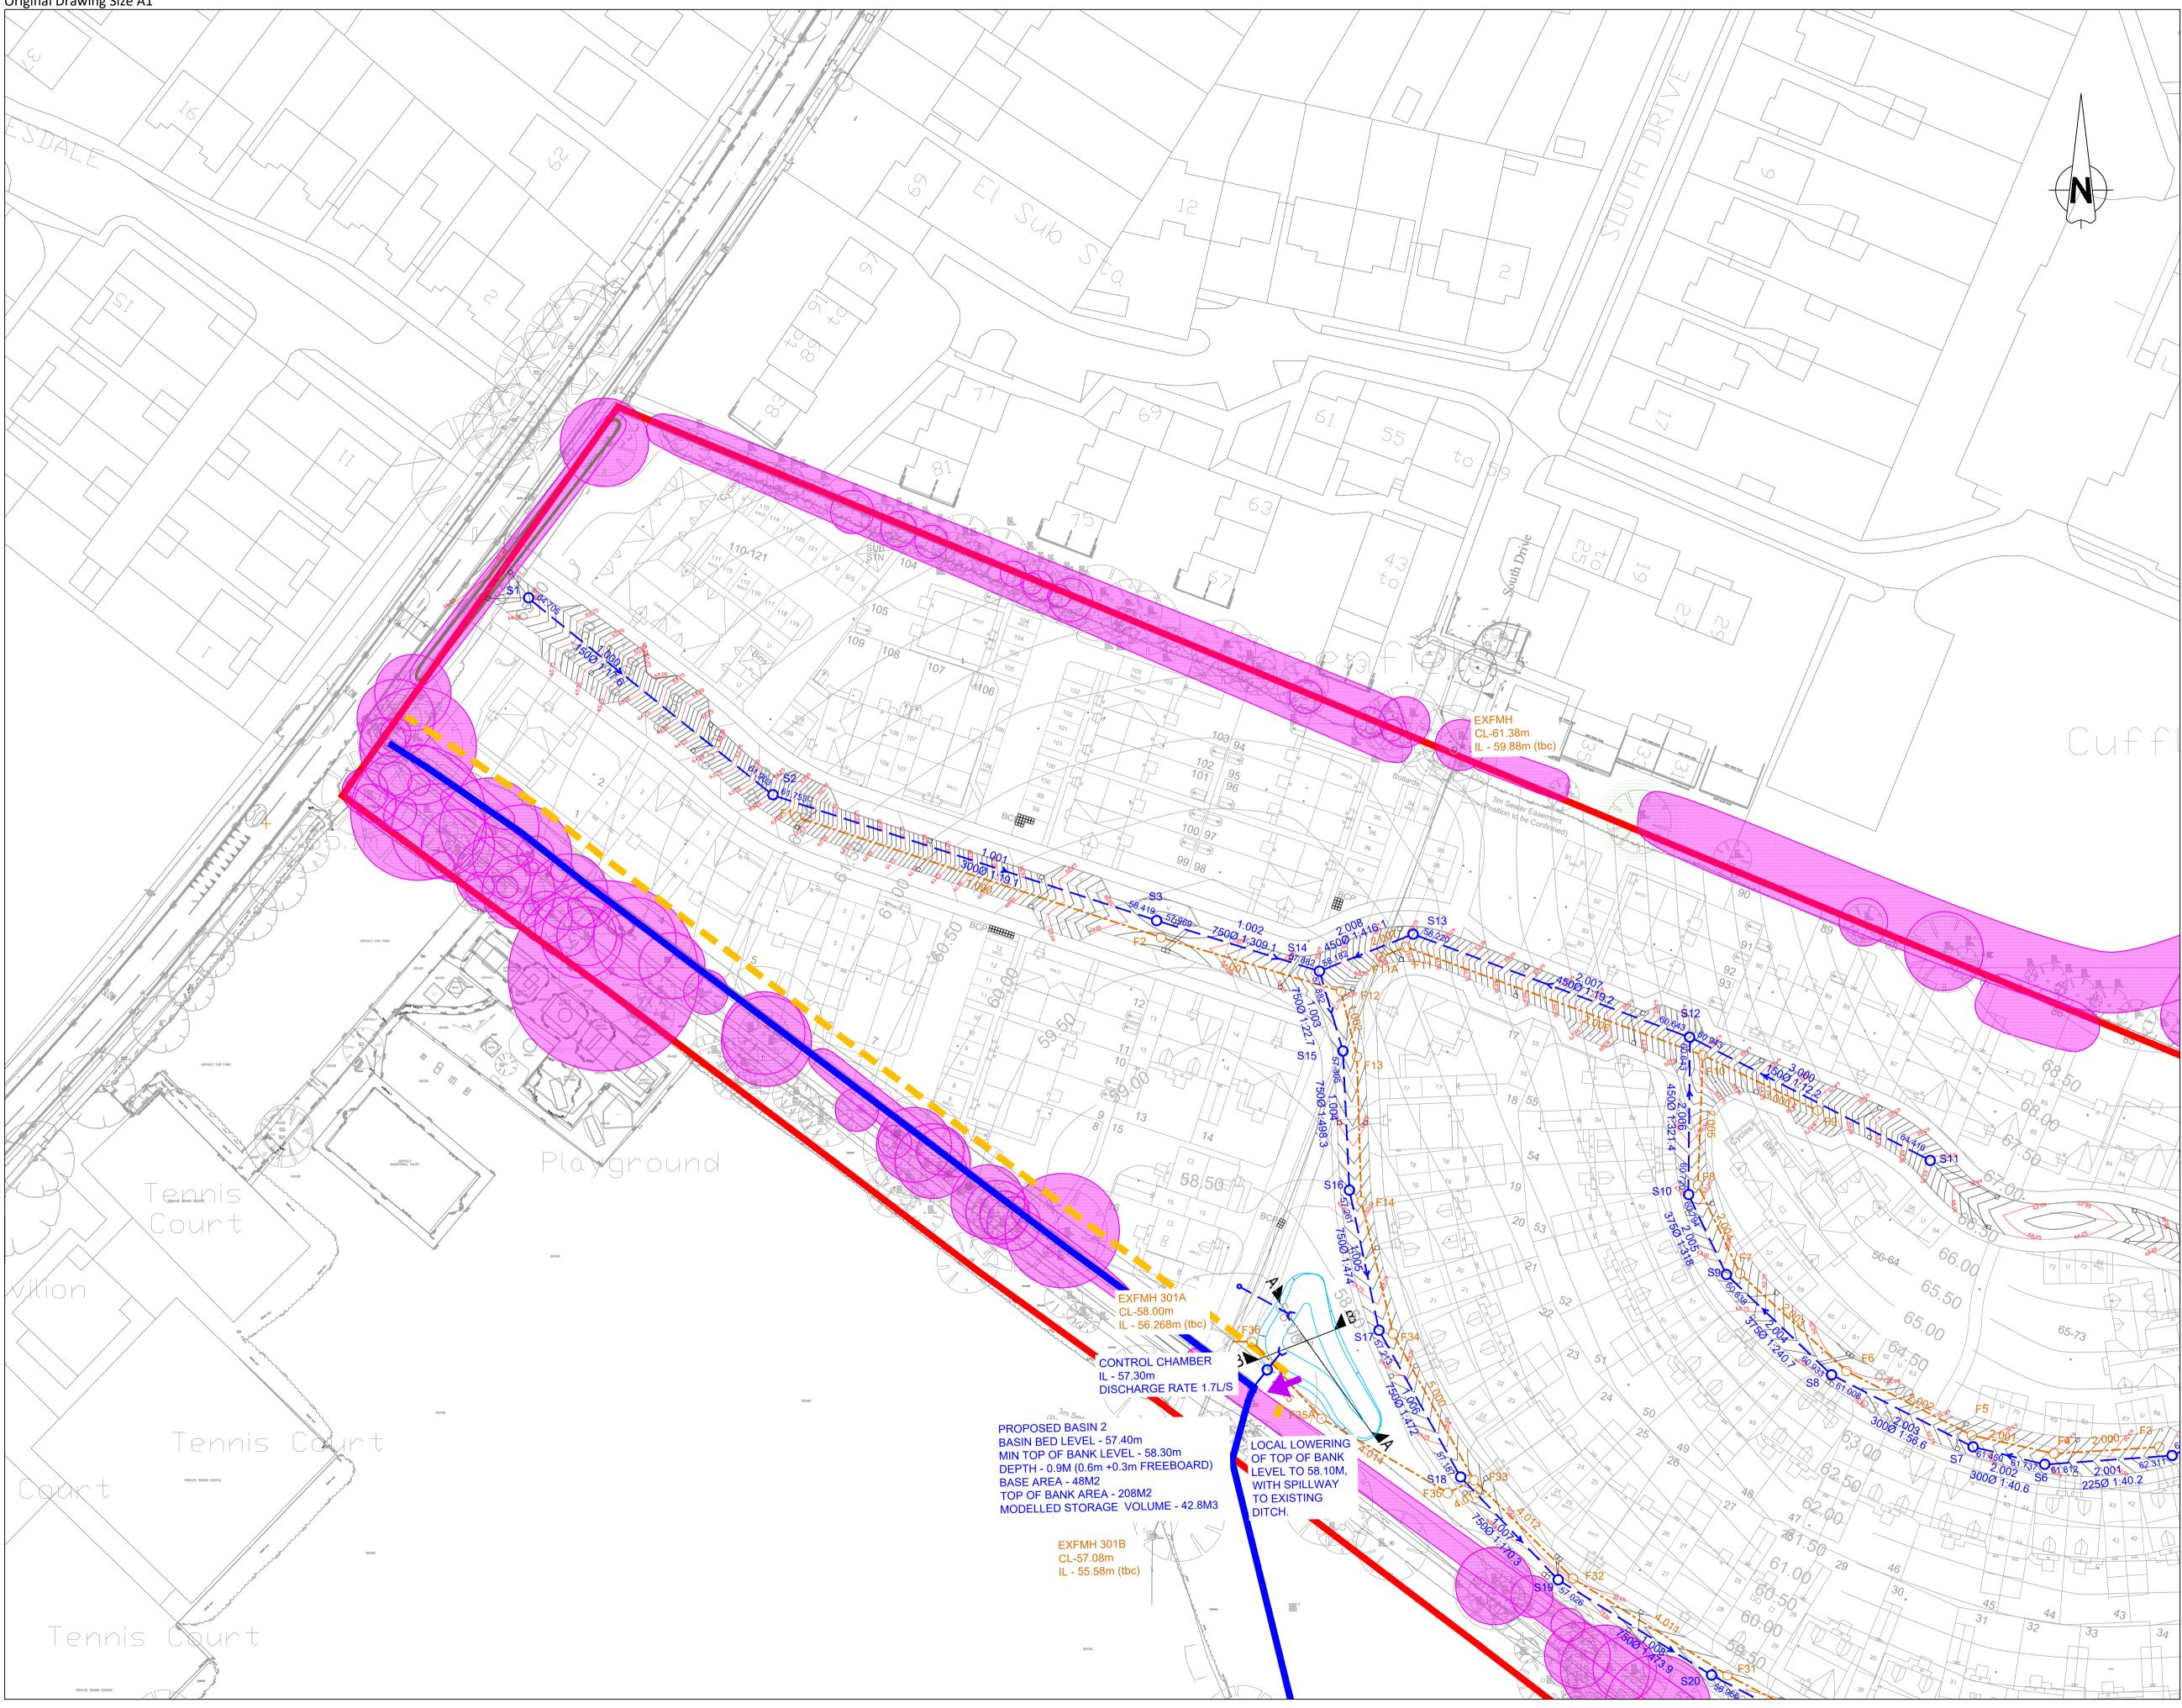

## 6.0 Limitations

- **6.1** The conclusions and recommendations contained herein are limited to those given the general availability of background information and the planned usage of the site.
- **6.2** Third party information has been used in the preparation of this report, which Brookbanks Consulting Ltd, by necessity assumes is correct at the time of writing. While all reasonable checks have been made on data sources and the accuracy of data, Brookbanks Consulting Ltd accepts no liability for same.
- **6.3** The benefits of this report are provided solely to Bellway Homes for the proposed development only.
- 6.4 Brookbanks Consulting Ltd excludes third party rights for the information contained in the report.

## NOTES:

- 1. Do not scale from this drawing.
- 2. All dimensions are in metres unless otherwise stated.
- 3. Brookbanks Consulting Ltd has prepared this drawing for the sole use of the client. The drawing may not be relied upon by any other party without the express agreement of the client and Brookbanks Consulting Ltd. Where any data supplied by the client or from other sources has been used, it has been assumed that the information is correct. No responsibility can be accepted by Brookbanks Consulting Ltd for inaccuracies in the data supplied by any other party. The drawing has been produced based on the assumption that all relevant information has been supplied by those bodies from whom it was requested.
- No part of this drawing may be copied or duplicated without the express permission of Brookbanks Consulting Ltd.
- 5. Precise line and level of the existing foul water sewer are to be notified to the Engineer prior to the commencement of the works.
